

### **Measles Exposure Timeframes and Locations**

The measles locations list indicates where there was an exposure to measles. Anyone who is not vaccinated, or may not have full immunity, could be affected. These are specific to a location and timeframe. This list is continually updated, and after 21 days of the incubation period, the measles locations will be removed.

**Note:** Locations where individuals may have been exposed to measles, but can be identified, are not listed. Those individuals will be notified separately.

**Currently, there are no new measles exposure locations in Kansas City, Mo., to report.**
